DocuLens Test Document C

Search, tables, Unicode, security notes, and manual checks

Purpose: Synthetic content for testing upload, extraction, search, highlighting, citations, comparison, tables, and export.

Note: Examples are fictional and are not professional advice.

1. Mixed punctuation and matching

Search strings: C++, C#, node.js, key-value, input/output, data_structure, user@example.test, 2026-10-16.

Repeated terms: reader reader reader. Case variants: Alpha ALPHA alpha. Unicode variants: café, naïve, résumé, Ελληνικ■, ■■■.

Bracket test: [computer] {algorithm} (data). Quote test: “smart quotes” and "straight quotes".

2. Structured content

ID	Name	Description	Count
T-100	Alpha	First test item	3
T-101	Beta	Second item with comma, included	0
T-102	Gamma	Text with < and > symbols	-1
T-103	Delta	Unicode: café, ■■, ■■■■■■	12

Check whether extracted tables preserve row and column relationships.

3. Long-form security passage

A document-processing application may receive files from sources it does not control. File names, metadata, extracted text, and embedded links should be treated as untrusted. Apply reasonable file-size and page-count limits, avoid trusting declared MIME types alone, and isolate parsing failures so one document cannot crash the workspace.

Search systems should distinguish a missing match from a parsing failure. If extraction is incomplete, show a clear limitation rather than a confident unsupported answer. A scanned image may require OCR; a text-only parser should not claim to extract text that is not present.

When text is sent to an external AI provider, explain what is sent and allow an informed choice. API secrets belong on the server. Error messages should be useful without exposing credentials, file-system paths, stack traces, or internal configuration.

4. Manual quality checklist

1. Upload all test PDFs and confirm each appears once.
2. Search computer, algorithm, data, and multiple terms together. Confirm stable, distinct highlight colours.
3. Use Inspect in Reader and verify correct document and page navigation.
4. Compare Documents A and B. Check shared concepts, differences, and document-specific information.
5. Export tables and confirm formula-like content is safely escaped.
6. Delete a document, reload the app, and confirm it does not reappear as a sample.
7. Test an empty library, failed upload, and unavailable AI provider.
8. Test a scanned PDF separately if OCR is intended. This pack does not simulate scanned-image PDFs.
